

# WHEN ALGEBRAIC GEOMETRY MEETS GRAPH THEORY

MOHAMED OMAR

ABSTRACT. Many graph theoretic problems, both structural and algorithmic, have benefited from the viewpoint of linear algebra. However, very few related results have come from the application of tools from algebraic geometry. In this talk we will discuss a particular application of Hilbert's Nullstellensatz, a celebrated theorem in classic algebraic geometry, to understanding 3-colorability of graphs. This is joint work with students Bo Li, Benjamin Lowenstein and several other co-authors.
